

REVERSE ROUND FLANGED BALL BUSHES

These ball bushings are designed with a flange that allows the bush to be mounted against a bulkhead. This reverse mounting means that the shorter part of the bushing is inserted into the housing (or bulkhead) and the longer part is protruding.

The fixing holes are counterbored on the opposite side of the flange to the usual arrangement to allow for this specific type of fixing. In addition, they are easily re-lubricated via the nipple (see drawing below)

The standard type has 2 seals and a plastic cage.

Part number FK62-3..

It is also available with all parts in steel.

Part number FK60-0..
